                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   A;Cross-references: DDBJ:D64140; NID:g1526423; PIDN:BAA11017.1; PID:g1526424
C;Comment: This protein is a phosphotyrosine protein which belongs to late embryogenesis
C;Genetics:
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Tate embryogenesis abundant protein - Arabidopsis thaliana
NyAlternate names: embryogenic cell protein 63; phosphotyrosine protein
C; Species: Arabidopsis thaliana (mouse-ear cress)
C; Date: 11-Apr-1997 #sequence_revision 09-May-1997 #text_change 21-Jul-2000
C; Accession: JC6171
R; Yang, H.; Saltou, T.; Komeda, Y.; Harada, H.; Kamada, H.
Gene 184, 83-88, 1997
A; Title: Arabidopsis thaliana ECP63 encoding a LEA protein is located in chromosome 4.
A; Reference number: JC6171; MUID:97169149
A; Accession: JC6171
A; Molecule type: mRNA
A; Residues: 1-448 cYAN>
                                                                                                                                                            14;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Sequence 8, Application US/08828741B

Patent No. 6043069

GENERAL INPORMATION:
APPLICANT: Koentgen, Frank
APPLICANT: Tarlinton, David M.
APPLICANT: Treuliein, Herbert R.
TITLE OF INVENTION: CAPALYIC ANTIBODIES AND A METHOD OF
TITLE OF INVENTION: PRODUCING SAME
NUMBER OF SEQUENCES: 14
CORRESPONDENCE ADDRESS:
ADDRESSEE: SCULLY, SCOTT, MURPHY & PRESSER
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Score 615; DB 4; Length 178;

                                                                                                                                                                                                                      light chains. It is useful for binding, separating (purifying) and identifying immunoglobulin and for removing immunoglobulin molecules from serum. Hybrid proteins of the L protein can bind all human immunoglobulin classes and many immunoglobulins from other species. They are highly soluble and retain their binding activity at high without loss over a pH range of 3-10. They can be immobilised without loss of activity.
                                                                                                                                                                                                                                                                                                                                                                                                        9

It is useful for binding, separating (puritying) and identifying immunoglobulin and for removing immunoglobulin molecules from serum. This is the coding sequence of one hybrid protein of the L protein. The hybrid proteins can bind all human immunoglobulin classes and many immunoglobulins from other species. They are highly soluble and retain their binding activity at high temperatures over a pH range of 3-10. They can be immobilised Gaps 9 1 AVENKEETPETPETDSEEEVTIKANLIFANGSTQTAEFKGTFEKATSEAYAYADTLKKDN 60 1 AVENKEETPETPETDSEEEVTIKANLIFANGSTQTAEFKGTFEKATSEAYAYADTLKKDN New protein L binding light chains of all immunoglobulin classes - for binding purifying and identifying immunoglobulin, also related DNA, vectors and host cells ; Length 434; Indels 100.0%; Score 1565; DB 14; 100.0%; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The specification describes a method for expressing and isolating a recombinant protein in a plant. The method comprising expressing a fusion protein including the recombinant protein and a callulose binding peptide fused to it, where the fusion protein is compartmentalised and sequestered within plant cells, plant derived tissue or cultured plant cells. The method is useful for obtaining large quantities of the recombinant proteins and protein products in a simple and cost-effective manner. Recombinant proteins may be used commercially, such as in the food processing industry, e.g. glucoamylases and glucose such as in the food processing industry, e.g. glucoamylases and glucose such as in the food processing industry, industry and for classes for isomercases for the hydrolysis of high molecular weight proteins and in manufacturing leather or alcoholic beverages, pectinesterases for pectin hydrolysis in food industry, lipases for cleaving expert linkage in triglycerides, and for effluent treatment. The recombinant proteins may further be used to produce protein antibiotics, which can be used in the alling processes, and to produce animal feed enzymes. The present sequence represents a fusion protein of the invention, and comprises a fusion of a cell signal peptide, protein L, CBD cex, and an endoplasmic reticulum retaining peptide.

invention also describes antibody-binding proteins (I) that comprise a combination of the signal peptide of a murine immunoglobulin (Ig) kappa chain or a murine MHC (major histocompatibility complex) Class I k(k) molecule; an antibody-binding site of proteins A, G, L or LG, and the transmembrane domain of PDGFR (platelet-derived growth factor receptor) or CD52. The method is used to select MAD with specificity for particular antigens. MAD can be selected without separate culture of hybridomas, and selection can be made against many antigens in a library, optionally on the basis of strength of affinity for a particular antigen. Complex mixtures of hybridomas can be used for selection, reducing the time and cost involved in MAD selection. This sequence represents the protein G contained in the expression vector pSEXILL4 which contains the protein G, Neo-R and the bla protein described in the method of the invention.
                                                                                                                                                                                                                                                                                                                      200

                                                                                                                                                                                                                                                  The synthetic immunoglobulin binding proteins derived from protein L correspond to the repeated sequences inprotein L which bind immunoglobulin kappa light chains. They can be used in protein analysis, purification procedures and other blochemical processes e.g. ELISA. The synthetic molecules are of particular advantage if they are free of regions in protein L which exhibit albumin and cell

                                                                                                                                                                                                                                                                                                                                             L comprise repeated sequences from protein L which bind immunoglobulin kappa light chains. They can be used in protein analysis, purification procedures and other blochemical processes e. g. ELISA. The synthetic molecules are of particular advantage if they are free of regions in protein L which exhibit albumin and cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             a
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               δy
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1,
                                                                                                                                                                                                                                                                                                                     This protein comprises growth factor TLHL, where L is the immunoglobulin binding entity from Peptostreptococcus magnus, H is residues 42-62 of hen eagy lysozyme, and T represents the variable kappa light chain (see AAM32483) from human myeloma protein LEN.

Was expressed in E. coli DH10B cells utilising a DNA construct (see AAT91598) produced from LHL (see AAT91986), kappa (see AAT91590) and synthetic linker oligonucleotides, and was purified from total bacterial lysate via a strep-tag. The linker contains a cleavage is the for tobacco etch virus (TPV) protease. TLHL was designed so that the kappa portion of the protein is cleaved by TEV protease into 'T' and 'LHL' moieties. Production of catalytic antibodies to a specific antigen comprises administering to an animal a growth factor comprising an antigen capable of interacting with a B cell bound catalytic antibody. The antigen is fused to a B cell surface molecule binding protein for the antigen to be cleaved and for the remainder of the molecule to induce B cell mitogenesis (claimed). LHL crosslinks with surface immunoglobulin on B cells. This induces be cell activation and blast formation. Internalisation and processing of LHL leads to the presentation of the H peptide signals the child contains and contains and undergo antibody class switching activated B cell intogralication of the H peptide signals the activated B cell intogralication and undergo antibody class switching and contains the activated B cell intogralication and undergo antibody class switching and contains the activated B cell intogralication and undergo antibody class switching and contains the c
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Growth factor precursor; B-cell surface; T cell surface; CAb; hepatitis;

The invention relates to a growth factor precursor that comprises B-cell surface binding part, antibody (CAb); and a peptide comprising heavy and light challed antibody (CAb); and a peptide comprising heavy and light chalms of immunoglobulin. When the antigen is cleaved the B cell surface part can interact with its target. The growth factor precursors are used to select B cells that produce Ag-specific CAb, and to generate CAb from such cells (by inducing mitogenesis, caused by the growth factor released by specific cleavage). The Ag-specific CAb can be directed against, e.g. tumour necrosis factor (treatment of rheumatoid arthritis or toxic shock syndrome); viral docking receptors (treatment of human immune virus, hepatitis and influenza infections); tumour-specific antigens; amyloid plaque (treatment of Alzheimer's disease or myeloman) or IGE (treatment of allergies such as asthma). CAD may also be used for drug detoxification, contraction as asthma). CAD may also be used for drug detoxification, contraction in a viral or other gene therapy vector. The particularly the growth factor precursors are produced by delivering the prowth factor or ordersponding nucleic acid in a viral or other gene therapy vector. The present sequence represents the amino acid sequence of TLHL. The LHL is a growth factor comprising H flanked by two L molecules where L is a B cell surface molecule binding portion from hore general cell, virus) sensitive competitive comprises the sequence region.
rheumatoid arthritis; toxic shock syndrome; viral docking receptor; human immune virus; tumour-specific antigen; amyloid biaque; myeloma; Alzheimer's disease; IGE; allergy; asthma; drug detoxification; autoimmune; inflammatory disease; gene therapy; protein L; P. magnus;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 --PKEEVTIKANLIYADGKTQTAEFKGTFE 115

This polypeptide comprises growth factor LHL-omp, where L is the immunoglobulin binding entity from Peptostreptococcus magnus and H is residues 42-62 of hen egg lysozyme. It was generated from is residues 42-62 of hen egg lysozyme. It was generated from LHL.seq (see AAW32481) such that the E. coli ompA signal sequence (generated by purifying LHL.seq from whole bacterial host cells) was eliminated. The N-terminal omp peptide found in LHL (see AAW32482), LHL.seq (see AAW32481) and TLHL (see AAW32482) induces multimerisation as demonstrated by a potentiation of biological activity as compared to recombinant LHL-omp. Production of catalytic antibodies to a specific antigen comprises administering to an animal a growth factor comprising an antigen capable of interacting with a B cell bound catalytic antibody. The antigen is fused to a B cell surface molecule binding protein for the antigen to be cleaved and for the remainder of the molecule to induce B cell mitogenesis (claimed). The observation that omp induces multimerisation allows the design of simpler molecules with the same desired biological function as the contraction by the process can have diagnostic and therapeutic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          New catalytic antibody precursors · comprising a B-cell surface molecule binding portion which can induce B-cell mitogenesis
                                                                                                                                                                    Catalytic antibody; growth factor; B-cell mitogenesis; LHL-omp; L protein; hen egg lysozyme; HEL.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Score 615; DB 18; Length 178;

```
The invention relates to a growth factor precursor that comprises B-cell surface binding part, antigen cleavable by a catalytic antibody (CAB); and a peptide comprising heavy and light chains of immunoglobulin. When the antigen is cleaved the B cell surface part can interact with its target. The growth factor precursors are used to select B cells that produce Ag-specific CAB, and to generate CAB from such cells (by inducing mitogenesis, caused by the growth factor released by specific cleavage). The Ag-specific CAB can be directed against, e.g. tumour necrosis factor (treatment of rheumatoid arthritis or toxic shock syndrome); viral docking receptors (treatment of human immune virus, hepatitis and influenza infections); tumour-specific antigens; amyloid plaque (treatment of Alzheimer's disease or myeloma) or IGE (treatment of alleques such as astima). CAB may also be used for drug detoxification, to treat autoinmune or inflammatory diseases and to eliminate environmental or industrial pollutants, such as plastics and petroleum. Particularly the growth factor precursors are produced by delivering the corresponding nucleic actid in a viral or other gene therapy vector. The present sequence represents the amino acid sequence of the LHL growth factor carrying an omph signal peptide (LHL.omp). L is a B cell surface molecule binding portion from hen egg lysosyme (HEL). LHL is a growth factor comprising H flanked by two L molecules.
                                                                                                                                                                                                                                                                                                                                                                                                      Growth factor precursor; B-cell surface; T cell surface; CAb; hepatitic catalytic antibody; immunoglobulin; tumour necrosis factor; influenza; rheumatoid arthritis; toxic shock syndrome; viral docking receptor; human immune virus; tumour-specific antiqen; amyloid plaque; myeloma; Alzheimer's disease; IGE; allergy; asthma; drug detoxification; autoimmune; inflammatory disease; gene therapy; protein L; P. magnus;

It is a modified form of LHL (see AAW32479) having an N-terminal FLAG epitope (see AAW32484) and a C-terminal strep-teg (see AAW32485) that facilitates purification. Production of catalytic antibodies to a specific antigen comprises administering to an animal a growth factor comprising an antigen capable of interacting with a B cell bound catalytic antibody. The antigen is fused to a B cell surface molecule binding protein for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to a growth factor precursor that comprises B-cell surface binding part, T cell surface binding part, antigen cleavable
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      the antigen to be cleaved and for the remainder of the molecule to induce B cell mitogenesis (claimed). LHL.seq has the same biological activity as LHL, which crosslinks with surface immunoglobulin on B cells. This induces B cell activation and blast formation. Internalisation and processing of LHL leads to the presentation of the H peptide on MHC II. T cell recognition of MHC II with the H peptide signals the activated B cell to proliferate and undergo antibody class switching and secretion. The catalytic therapeutic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -----PKEEVTIKANLIYADGKTQTAEFKGTFEEA 117

by a catalytic antibody (CAb); and a peptide comprising heavy and light chains of immunoglobulin. When the antigen is cleaved the B cell surface part can interact with its target. The growth factor precursors are used to select B cells that produce Ag-specific Cab, and to generate CAb from such cells (by inducing mitogenesis, caused by the growth factor released by specific cleavage). The Ag-specific Cab can be directed against, e.g. tumour necrosis factor (treatment of rhemmatoid arthritis or toxic shock syndrome); viral docking receptors (treatment of human immune virus, hepatitis and influenza infections); tumour-specific antigens; amyloid plaque (treatment of Alzheimer's disease or myeloma) or IGE (treatment of plaque (treatment of Influenza infections); tumour-specific antigens; amyloid place (treatment of Influenza infections); tumour-specific antigens; amyloid place (treatment of Influenza infections); tumour-specific antigens; amyloid place (treatment of Influenza infections); tumour-specific antigens, amyloid perticularly the growth factor precursors are produced by delivering the corresponding nucleic acid in a viral or other gene therapy vector. The present sequence represents the amino acid sequence of the LHL growth factor arrying a N-terminal FLAG epitope and a C-terminal strep tag. I is a B cell surface molecule binding portion from protein Loft of Pysosyme (HEL). LHL is a growth factor comprising H flanked by two L
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  1;

binding entity of Peptostreptococcus magnus, H is residues 42-62 of then egg lysozyme, and T represents the variable kappa light chain (see AAW32483) from human myeloma protein LEN; and (b) an additional, C-terminal kappa protein, the elements of CATAB-TEV being joined by protease. CATAB-TEV was designed so that the kappa portions of the proteins. CataB-TEV was designed so that the kappa portions of the proteins. Production of catalytic antibodies to a specific antigen comprises administering to an animal a growth factor comprising an entibody. The antigen to be cleased to a secific antigen antipody. The antigen is fused to a B cell surface molecule binding protein for the antigen to be cleaved and for the remainder of the molecule to induce B cell mitogenesis (claimed). LHL (see CaPAB-TEV) crosslinks with surface immunoglobulin on B cells. This

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              induces B cell activation and blast formation. Internalisation and processing of LHL leads to the presentation of the H peptide on MHC II. T cell recognition of MHC II with the H peptide signals the activated B cell to proliferate and undergo antibody class switching and secretion. The catalytic antibodies generated by the process can have diagnostic and therapeutic applications.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           20; Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     16 SEEEVTIKANLIFANGSTQTAEFKGTFEKATSEAYAYADTLKKDNGEYTVDVADKGYTLN 75
                                                                                                                        This polypeptide comprises CATAB-TEV, a synthetic growth factor composed of: (a) TLHL (see AAW91589), where L is the immunoglobulin
               New catalytic antibody precursors - comprising a B-cell surface molecule binding portion which can induce B-cell mitogenesis

The invention relates to a growth factor precursor that comprises B-cell surface binding part, antigen cleavable by a catalytic antibody (CAb); and a peptide comprising heavy and light chains of immunoglobulin. When the antigen is cleaved the B cell surface part can interact with its target. The growth factor precursors are used to select B cells that produce Ag-specific CAb, and to generate CAb from such cells (by inducing mitogenesis, caused by the growth factor released by specific cleavage). The Ag-specific CAb can be directed against, e.g. thmour necrosis factor (treatment of Appending arthritis or toxic shock syndrome); viral docking receptors (treatment of human immune virus, hepatitis and influenza infections); tumour-specific antigens; amyloid allergies such as asthma). CAb may also be used for drug detoxification, to treat autoimmune or inflammatory diseases and to eliminate allergies such as asthma). CAb may also be used for drug detoxification, to treat autoimmune or inflammatory diseases and to eliminate corresponding nucleic acid in a viral or other gene therapy vector. The particularly the growth factor precursors are produced by delivering the corresponding nucleic acid in a viral or other gene therapy vector. The present sequence represents the amino acid sequence of CAPTAB-TEV which is assembled from TLHI and kappa by PCR. The LLL is a growth factor comprising H flanked by two molecules where L is a B cell surface molecule binding portion from protein L of P. magnus; H is a T cell surface molecule binding portion from hen egg lysosyme (HEL). THH is cut in the Linked to kappa chain via TEV (tobacco etch virus) sensitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ij
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Growth factor precursor cleaved by antigen-specific catalytic

"Purification and characterization of Streptococcus sobrinus
dextranase produced in recombinant Escherichia coll and sequence
analysis of the dextranase gene.";

J. Bacteriol. 176:383-3860(1994).

-I- FUNCTION: MAY PLAY A ROLE IN SUCROSE-INDEPENDENT ADHERENCE TO THE
PELLICLE-COATED TOOTH SURFACE. THE ACTIVITY OF THIS ENZYME IS
OPTIMAL AT PH 5.3 AND AT 39 DEGREES CELSIUS.

-I- CATALYTIC ACTIVITY: Endohydrolysis of 1,6-alpha-D-glucosidic
                                                                                                                                                                                             MEMBRANE ANCHOR (BY SIMILARITY).
CYTOPLASMIC (BY SIMILARITY).
CONSERVED IN GRAM-POSITIVE COCCI SURFACE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                113 TFEEATAEAYRYADALKKDNGEYTVDVADKGYTLNIKFAGKEKTPE---EPKEEVTIKAN 169

Biol. Chem. 268:16679-16687(1993).

-1- FUNCTION: NEUROFILAMENTS USUALLY CONTAIN THREE IF PROTEINS: L, M, AND H WHICH ARE INVOLVED IN THE MAINTENANCE OF NEURONAL CALIBER.
-1- PTM: THERE ARE A NUMBER OF REPEATS OF THE TRIPEPTIDE K-S-P, NFM IS PHOSPHORYLATED ON A NUMBER OF THE SERINES IN THIS MOTIF. IT IS THOUGHT THAT PHOSPHORYLATION OF NFH RESULTS IN THE FORMATION OF INTERFILAMENT CROSS BRIDGES THAT ARE IMPORTANT IN THE MAINTENANCE
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             OF AXONAL CALIBER.

PTM: PHOSPHORYLATION SEEMS TO PLAY A MAJOR ROLE IN THE FUNCTIONING
OF THE LARGER NEROFFILAMENT POLYPEPTIDES (NF-M AND NF-H), THE
LEVELS OF PHOSPHORYLATION BEING ALTERED DEVELOPMENTALLY AND
COINCIDENT WITH A CHANGE IN THE NEUROFILLAMENT FUNCTION.

MEDLINE PROBLEM OF MICHOLOUSE MAPIBOR (MAPIB)

In rat CNS and PNS during development.",
J. Neurosci. Res 49:319-332(1997).

I. FUNCTION: The function of brain MAPS is essentially unknown.
Phosphorylated MAPIB may play a role in the cytoskeletal changes that accompany neurite extension. Possibly MAPIB Binds to at least two tubulins neubmits in the polymer, and this bridging of subunits might be involved in nucleating microtubule polymerization and in stabilizing microtubules.

II SUBURITY: 3 different light chains, LCl, LC2 and LC3, can associate with MAPIA and MAPIB proteins.

Cerebellum and cerebrum). Not expressed in liver, spleen, kidney,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         nerve levels are high early in development but decrease during postnatal development and are low in adults. In dorsal root ganglia levels remain high throughout development.

INDUCTION: By nerve growth factor.

DOMAIN: Has a highly basic region with many copies of the sequence KKEE and KKEI/V, repeated but not at fixed intervals, which is responsible for the binding of MAPIB to microtubules.

PTM: LC1 is coexpressed with MAPIB. It is a polypeptide generated from MAPIB by protecolytic processing. It is free to associate with both MAPIB and MAPIB. It interacts with the amino-terminal region of MAPIB (By similarity).
